### ☑ Instructions

## **Uppsala University**

### **Department of Information Technology**

Cryptology (1DT075)

2021-03-19

**Instructions:** Read through the complete exam and note below any unclear directives before you start solving the questions.

The exam is **open book**: you are allowed to use course material, text books, your own notes, and any material that was created before the start of the exam. Remember to give credit (i.e. to provide references) when you use a third-party source. You are also allowed to use technical aids, e.g. a calculator.

The exam is **individual**: you are NOT allowed to get help from other people to answer the questions. Do NOT share or discuss the questions with other people (online or otherwise). Do NOT share or discuss solution approaches with other people. Do NOT submit other people's answers as your own.

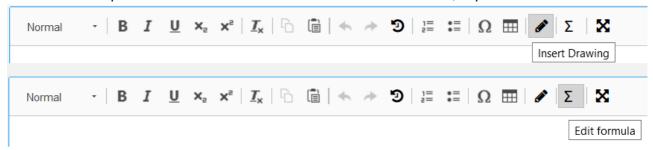

Grading scale. 0-49 pts. (U), 50-69 pts. (3), 70-84 pts. (4), 85-100 pts. (5)

You can email me at **teo.asplund@it.uu.se** for any emergency questions during the examination. Important announcements or clarifications will be posted on Studium on the homepage of the course.

If you find any unclear you think is unclear.	lf you find any unclear directives, please note the question number below and explain wha you think is unclear.									

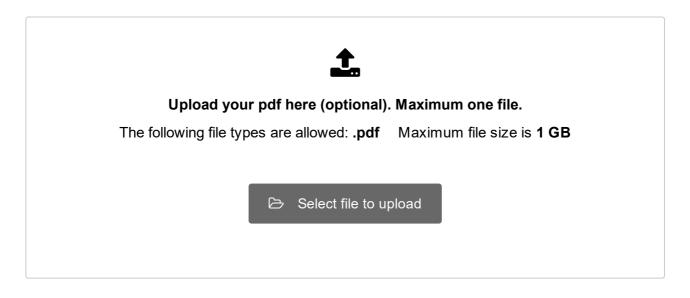

## Optional Supplementary PDF

The answers to the questions should, generally speaking, be filled out in the provided text input areas for each question. Please note the tools available in the toolbar, in particular:

However, if you find the available tools restrictive when answering some part of a question, you may upload a supplementary pdf here with figures, equations, etc. and refer to the relevant parts of the supplementary pdf in your answers here on Inspera.

This upload is optional. If you do not have any problems answering the questions using the tools provided here, there is no need to upload a supplementary pdf.

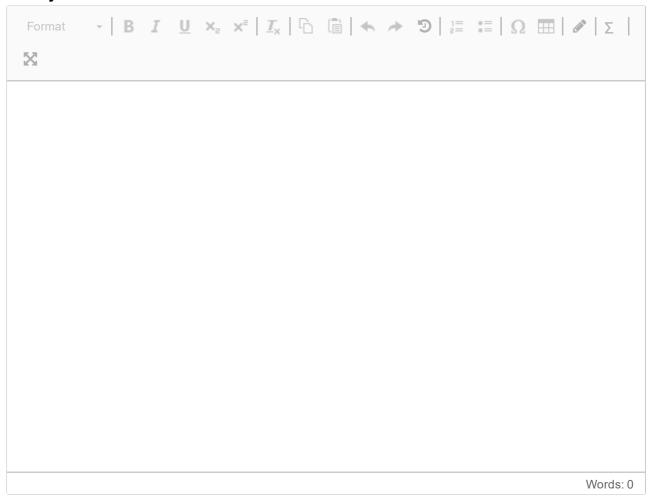

## <sup>2</sup> Unpadded RSA

A value has been encrypted using unpadded RSA. You do not know the private key (but you do have access to the public key). How would you go about

- a) finding the encryption of double the encrypted value?
- (2 pts)
- b) discuss why, generally speaking, using unpadded ("textbook") RSA for encryption is not a good idea
- (3 pts)

### Man-in-the-middle

Assume there is a man-in-the-middle, Mallory, in between a customer's (Alice's) computer and a bank. Mallory is listening to messages between the bank and its customers and has figured out some properties of the messages:

• She can identify messages from a customer to the bank that indicate that some amount of money, x, should be transferred from the customer's account  $y_1$  to account  $y_2$ . These have the form

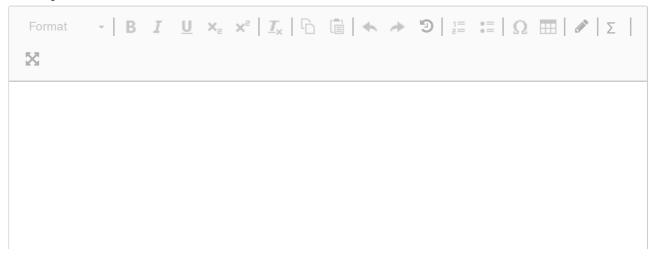

```
z \mid\mid enc_?(y_1) \mid\mid enc_?(y_2) \mid\mid h(z \mid\mid enc_{RSA}(x) \mid\mid enc_?(y_1) \mid\mid enc_?(y_2)) \mid\mid enc_{RSA}(x)
```

where || indicates concatenation,  $enc_?$  is some unknown encryption function that always returns the same value for a given input, h is a known, fixed hash function, and  $enc_{RSA}$  is RSA encryption using the bank's public RSA key, z is a random-looking string, which differs from message to message, but whose value does not depend on any of the other bits of the message.

- Mallory does not know how to generate such messages herself (in particular, she does not know how to generate z).
- The lengths for each part z, enc?, and h are fixed and do not vary between messages.
- A transfer of money from Alice to Bob is performed by Alice sending such a message to the bank, where  $y_1$  is Alice's account,  $y_2$  is Bob's account and x is the amount of money that should be transferred.
- The bank checks whether messages have been changed using the hashed value.
- a) Mallory captures such a transfer message sent from Alice to the bank, intending to transfer money from her account to Bob's. How can Mallory modify the captured message so that it instead requests to transfer an amount of money chosen by Mallory to Mallory's account from Alice's? You may make reasonable assumptions as long as they are clearly stated. (5 pts)
- b) Having been made aware of its completely flawed system, the bank has tasked you with coming up with a better approach for providing internet banking services (i.e. money transfers) to its customers. What knowledge from the course could you apply to this task, and how? Discuss the cryptographic aspects of your system design (e.g. confidentiality, message integrity, authentication, potential attacks, and so on). What choices would you make, and why? What are the main issues that need to be addressed and how have you tackled them? Provide a detailed technical discussion; explain and motivate your choices.

  (35 pts)

## <sup>4</sup> Hash Functions

- a) Show that any hash function must have collisions.(2 pts)
- b) Since any hash function must have collisions, how can we hope to provide collision resistance? (1 pt)
- c) Given a collision resistant function f that takes 1024-bit values and yields a digest of size 256 bits, can we use f to construct a collision resistant hash function (taking values of any length) that returns digests of size 256 bits? If yes, how? If no, why not?

  (2 pts)

# <sup>5</sup> Blind Signature Scheme

Explain, in detail, the concept of a blind signature scheme and suggest a way of using homomorphic encryption to implement such a scheme.

(10 pts)

# <sup>6</sup> Cryptosystem

Let (P,C,K,E,D) be a cryptosystem. Is it true that, given any  $k\in K$ , decryption for any pair of ciphertexts  $c_1,c_2\in C$  has the property  $d_k(c_1)=d_k(c_2)\implies c_1=c_2$ ? If yes, prove it, if no, give a counterexample.

(5 pts)

## 7 Hill Cipher Encryption

a) Using a Hill cipher with the key

$$k = egin{bmatrix} 5 & 2 & 0 \ 3 & 3 & 4 \ 6 & 2 & 1 \end{bmatrix}$$

encrypt the last three characters of your exam registration code (where the characters are encoded in the usual way, i.e. A = 0, B = 1, ..., Z = 25, as elements of  $\mathbb{Z}_{26}$ ). Briefly show and explain the calculation.

(5 pts)

b) What is required of the key, k, in order to be able to decrypt? Why? (5 pts)

## 8 Steganography

Suppose you have a color bitmap image that is 20 pixels wide and 20 pixels tall, where each pixel is represented using 3\*8 bits. You want to hide an English text that is 400 characters long in the pixel data of this image.

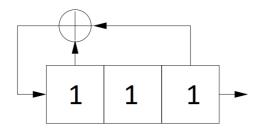

- a) How would you go about it? Be as detailed as possible and state any assumptions that you make.
- (6 pts)
- b) How might an attacker go about detecting that there is a hidden message? (2 pts)
- c) Discuss the robustness of your method. How might an attacker go about trying to destroy the hidden message? (2 pts)

#### Fill in your answer here

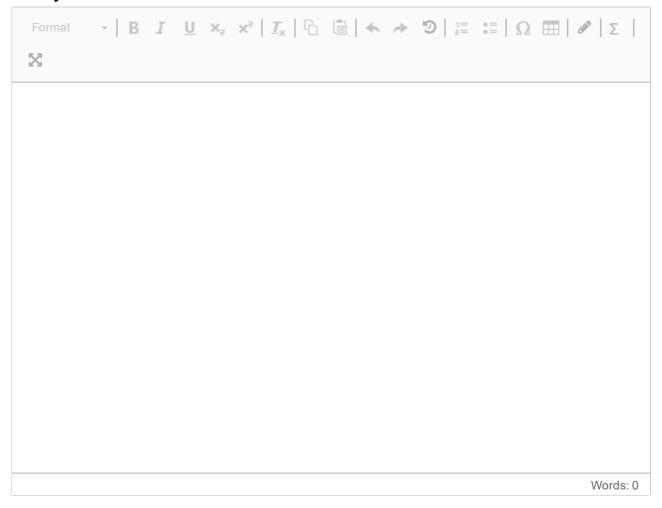

## 9 LFSR

Consider the following linear feedback shift register (where ⊕ denotes addition modulo 2):

- a) Compute the output sequence generated by this LFSR.(3 pts)
- b) Assume we use the output of this LFSR as bits of keys used for encryption using the Vernam cipher. Does it provide perfect secrecy? If yes, why? If no, why not? (2 pts)

#### Fill in your answer here

### <sup>10</sup> Probabilities

Assume an unfair coin which has a probability of 0.8 of landing heads up and a probability of 0.2 of landing tails up.

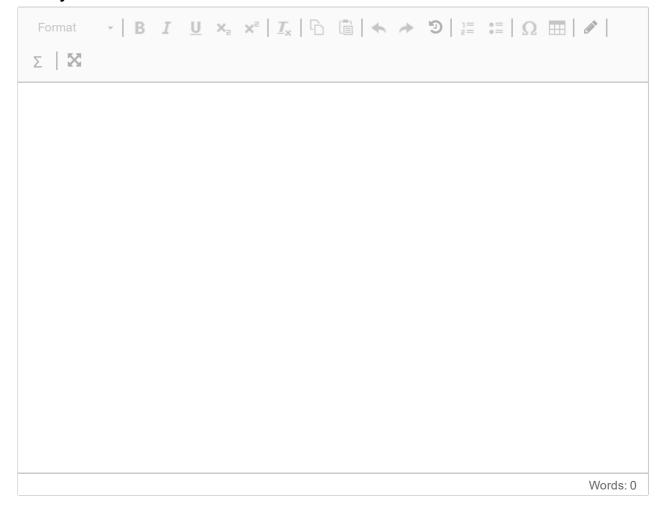

a) What is the entropy of the random variable X that models this coin flip? Include the calculation. (1 pt)

Imagine we use this unfair coin to generate a sequence of bits in the following manner:

- Flip the coin twice, recording the result of each flip as 1 for heads, 0 for tails.
- If the two flips yield different values (i.e. heads followed by tails or v.v.) output the first recorded value to our output sequence, otherwise do nothing.
- Repeat the above two steps until we have generated as many bits as we want.
- b) For every generated bit, what is the probability that it is a 0, using this method? What is the probability of a 1? Explain your reasoning.
  (3 pt)
- c) What is the entropy of the random variable that models the generation of such a bit? Explain how you reached the answer.

  (1 pt)

Maximum marks: 5

# <sup>11</sup> Quantum Key Distribution

Alice and Bob are using the BB84 quantum key distribution scheme. The following session occurs:

- a) In the above session, what is the sifted key?(1 pt)
- b) What is an advantage that the quantum key distribution scheme has over non-quantum approaches?
  (2 pts)
- c) The next day Alice is trying to send a new key to Bob, however, this time Eve is eavesdropping. Explain how this can be detected by Alice and Bob. (2 pts)
